❖Errors And With His Solution

❖ Error 1: Program may crash if user enters text

- **Error:**
  If the user enters a **string or letter** instead of a number, the program will crash.

Example:

- choice = int(input("1. Withdraw 2. Deposit: "))

- **Solution:**
  Use try–except to handle invalid input.

```
try:
   choice = int(input("1. Withdraw  2. Deposit: "))
except:
   print("Invalid input. Enter numbers only.")
```

❖ Error 2: Negative amount not checked

- **Error:**
  User can enter a **negative amount**, which will give wrong balance.

Example:

- amount = int(input("Enter withdraw amount: "))

- **Solution:**
  Check amount is positive.

```
if amount > 0 and amount <= balance:
```

❖ Error 3: No loop (ATM runs only one time)

- **Error:**
  The program stops after one transaction.
- **Solution:**
  Use a loop to run the ATM again.

```
while True:
   # ATM code here
```

❖ Error 4: Deposit of negative amount

- **Error:**
  Negative deposit will reduce balance.

- **Solution:**
  Add validation.

```
if amount > 0:
   balance = balance + amount
else:
   print("Invalid amount")
```

❖ Error 5: No exit option

- **Error:**
  User cannot exit the ATM properly.
- **Solution:**
  Add exit choice.

```
print("1. Withdraw  2. Deposit  3. Exit")
```

❖ Error 6: No PIN security

- **Error:**
  Anyone can access the ATM without a PIN.
- **Solution:**
  Add a PIN check before the menu.

```
pin = int(input("Enter PIN: "))
   if pin == 1234:
      print("Access granted")
else:
   print("Wrong PIN")
```
